

Note: The sides and tops of the Fytowall modules must be surrounded to resist plant dehydration. This surround is supplied and installed by others. Choice of materials, finishes etc. is extensive with Stainless steel, Colourbond and Zinalume being the most common. The main requirement is that the material be suitable for a continuously moist environment. An alternative to a manufactured frame is for the host wall to be recessed. Some framing might still be necessary to conceal edges and irrigation lines.
